# Data and Digital

## Improving the use, accessibility and quality of Open Data across the public sector

## What we're doing

- Development of the **Artificial Intelligence (AI) Register**. Launched in 2023, the Scottish AI Register provides information on the AI systems in use or in development within the Scottish public sector.

- Development and delivery of the Data Maturity Programme for public sector organisations to outline what 'good data' looks like - including the process by which public sector organisations can improve their data and adoption of standards to be useful for civil society.

- Running a **CivTech challenge** to evaluate if technology can make public sector data easy to find, assess outcomes and set out the way forward. A CivTech challenge involves teams, individuals or companies creating digital solutions to public sector problems.

- Reviewing the front end of Scottish Government's official statistics and open data publishing platform, www.statistic.gov.scot.

- Increasing the amount of Scottish public sector open data being published, through collaborations such as the Data Standards and Open Data Community of Practice.
